3		Database Designing	In progress ▾
4		BackEnd Development	In progress ▾
5		Testing And Implementation	Not started ▾
6		Deployment	Not started ▾

Problem Statement:

The current way we handle student information across different departments in our institution is causing a lot of problems:

- **Inconsistent Data Management:** Student data is all over the place, making it hard to keep track of everything and leading to mistakes in things like enrollment and resource management.
- **Communication Fragmentation:** We don't have a single system for sending out important messages, so announcements get lost in the shuffle, making it tough to coordinate effectively.
- **Slow Information Flow:** We don't have a streamlined process for communication, important info takes too long to reach the right people, slowing down decision-making and how smoothly we run things.
- **Administrative Burden:** Managing student data manually, sorting out conflicts, and keeping up with different rules and categories is a big headache. It's taking up a lot of time and energy for the administration that could be better spent on improving the institution.

PROJECT-FLOW:

➤ **Purpose:**

To develop a student information management system that facilitates Managing student data, data import/export, and record filtering, simplifying administrative tasks and improving efficiency in managing student data.

➤ **Scope:**

This system includes user authentication, data entry forms for Managing student data, data import/export functionalities, and a user-friendly interface for filtering and viewing student records. It aims to centralize student information and streamline administrative processes.

➤ **Business Context:**

The student information management system is designed to alleviate administrative burden and enhance data management practices within the institute. Primary stakeholders include administrative faculties responsible for managing student records and facilitating administrative tasks.

➤ **Consideration:**

- Integration with authentication mechanisms for user access control.
- Compatibility with existing database systems and data formats.
- User-friendly interface for easy navigation and data entry.

➤ **Dependencies:**

- Integration with authentication systems for user login and access control.
- Compatibility with existing database structures and formats for data import/export.

➤ **User Stories:**

- As an administrator, I want to register and authenticate users to grant them access to the system.
- As an administrator, I want to import student data from external sources to maintain comprehensive records.
- As a user, I need to export student data in various formats for reporting purposes.
- As a user, I want to filter student records based on specific criteria to retrieve relevant information for analysis and decision-making.
- As an administrator, I need to manage student data and user accounts and configure access permissions to ensure data security and integrity.

Product Perspective:

The Student Database Management System (SDMS) serves as a centralized platform for administrative purposes within educational institutions. It caters exclusively to the needs of institute management, providing essential functionalities for data management and administrative tasks related to student information.

Product Functions:

The SDMS offers the following core functionalities:

- User Registration and Authentication for secure system access.
- Managing student data for comprehensive student record management.
- Data Import and Export for seamless integration and reporting.
- Record Filtering based on diverse student attributes for efficient data retrieval.
- Administrative Tools for user account management, system configuration, and access control.

Specific Requirements:

User Roles:

- **Administrator:** Responsible for managing student data, portal data and system settings, with full access to all functionalities.
- **User:** Responsible for viewing and using all the data of students with multi functionalities of importing, exporting, filtering under the supervision of administrators.

Functional Requirements:

➤ User Registration and Authentication:

- User registration page for administrators and data entry operators.
- Login functionality to authenticate users and grant access to the system.

➤ Managing Student Data:

- Forms for creating, updating, and deleting student records.
- Search functionality to retrieve specific student records based on user-defined criteria.

➤ Data Import and Export:

- Tools for importing student data from CSV files or other external sources.
- Export functionality to generate reports and export student data in various formats (e.g., CSV, Excel).

➤ Record Filtering:

- Filters and search options to retrieve student records based on department, gender, year, status, hostel, community, quota, and category.
- Advanced filtering options for customized data analysis.

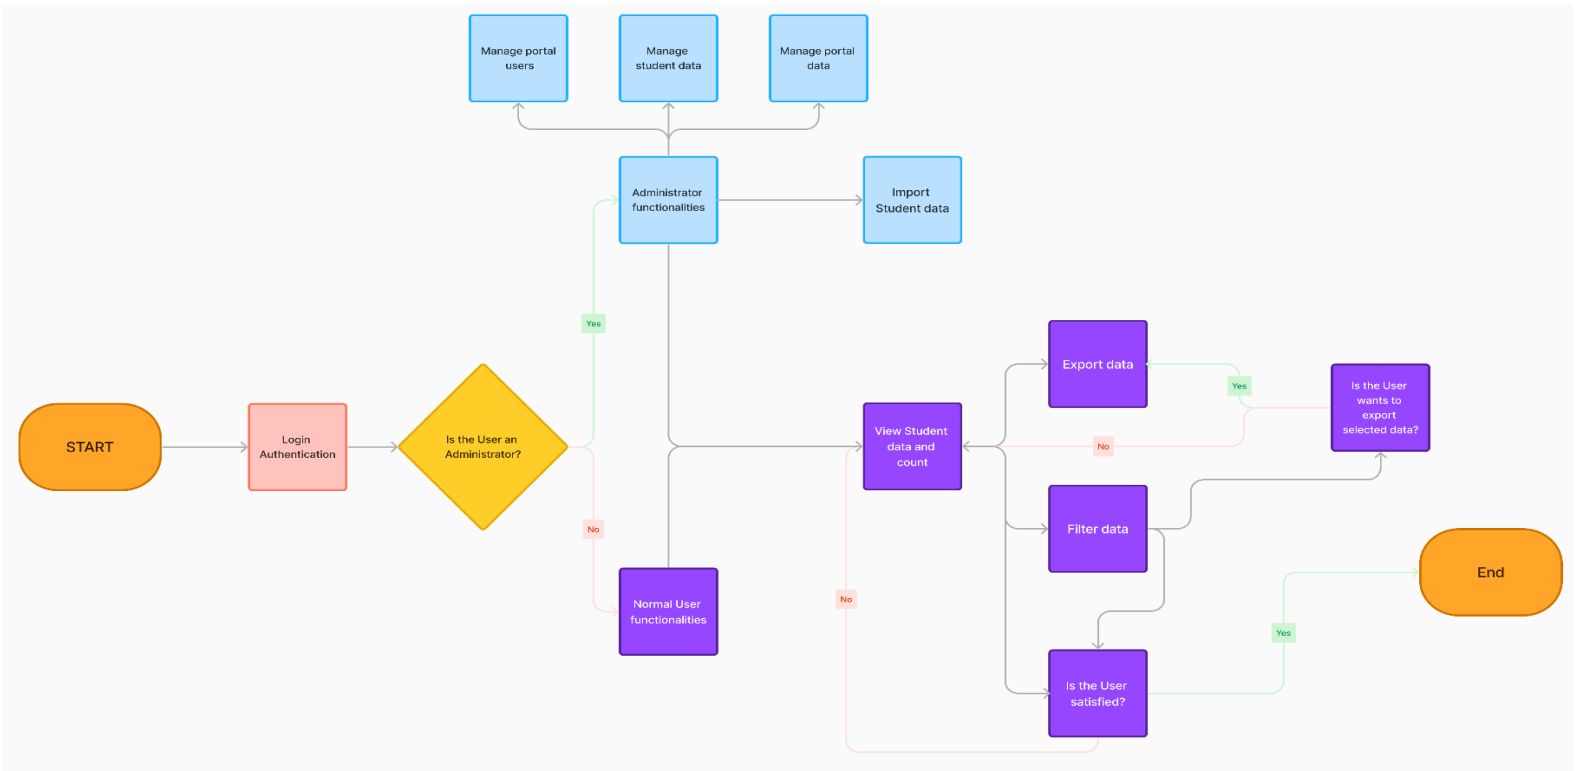

➤ Administrative Tools:

- User management interface for adding, updating, and deleting user accounts.
- System settings page for configuring access permissions and other administrative settings.

Additional Considerations:

- **Security:** Secure user authentication and data encryption to protect user privacy.
- **User Interface (UI):** A user-friendly and intuitive interface for both administrators and normal users.

WEB APP WORKFLOW:
